

# Integrated Command & Control: C4I

## ARGUS

ARGUS represents a flexible and tailor made operational tool which fuses the data of various types of sensors. Argus monitors and provides early warning short/long range targets, and identifies any attempt to approach, penetrate or attack the critical asset, using a high performance integrated sensor suite, enabling efficient activation of reacting forces and counter-measures.

The concept behind ARGUS is a multi layer, multi sensor system, combining radars, electro-optic sensors, passive unattended sensors, and additional measures for day/night coverage capability. The system provides cost effective solution for protecting strategic areas in real time, enabling the creation of a reliable awareness picture, event management, and effective activation of countermeasures.

This real-time operational integrated Command & Control (C&C) C4I is a flexible and easy to deploy unit that is built to combine the best of breed equipment under a common C&C system, creating an overall integrated picture for decision makers.
